

Autonomous User Flow

1. THE 402 CHALLENGE LOOP

1. Agent requests /v1/vwap/BTC-USD.
2. Server returns 402 Payment Required.
3. PAYMENT-REQUIRED lists the exact amount, asset, network, and resource.
4. An official x402 v2 client signs the selected authorization.
5. Agent retries the exact request with PAYMENT-SIGNATURE.

2. DETERMINISTIC UNLOCK

After facilitator verification, successful settlement, and durable local finalization, the gateway returns the paid JSON payload and prevents proof replay. Authenticated connectors can separately use an eligible starter allowance.
